

Monthly and Seasonal Outlook of Rainfall for Chattogram and Cox's Bazar Region, Bangladesh

Issued on August 07, 2026

For the Month of August and August-September-October

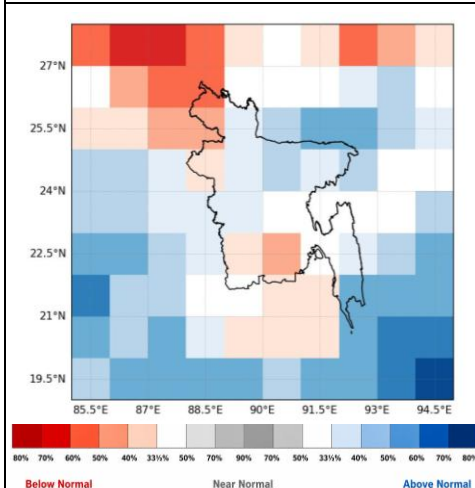

Observed Climate in July 2026

The cumulative rainfall for the month of July in Cox's Bazar was 1409 mm and in Teknaf was 1540 mm which indicates in Cox's Bazar (44%) above normal and Teknaf (27%) above normal rainfall during July. For reference, based on the climatology (1991-2020) the normal cumulative rainfall for the month of July is 978 mm in Cox's Bazar and 1209 mm in Teknaf. The overall rainfall scenario is normal (51%) for Chattogram in the month of July.

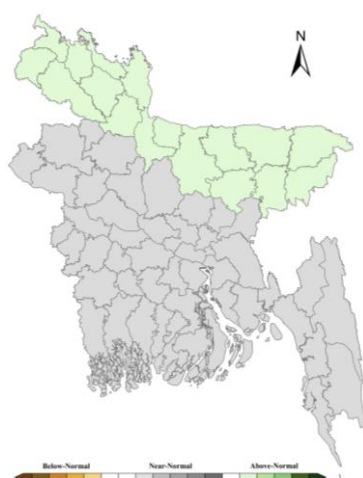

Outlook for August 2026

Considering World Meteorological Organization (WMO) designated global center model outputs, RIMES FOCUS probabilistic outlook, and BMD's deterministic forecast, there is a 40-50% chance of near normal rainfall in Cox's Bazar region during the month of August. For reference, based on the climatology (1991-2020), the normal cumulative rainfall for the month of August in Cox's Bazar is 964 mm and Teknaf is 922 mm. Overall, analyzing the available model output, it is likely to be near normal rainfall for the whole country during the month of August.

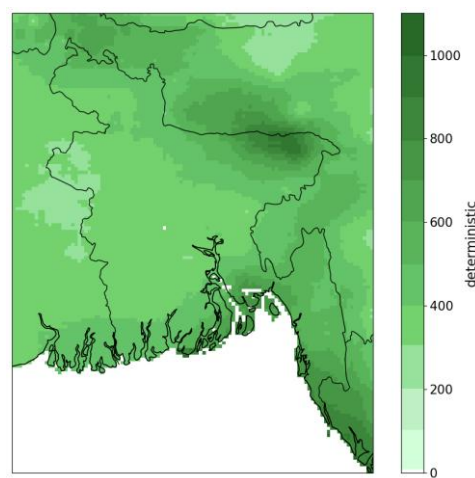

RIMES FOCUS Probabilistic for August

Probabilistic Multi-Model Ensemble Rainfall Forecast for August

BMD Deterministic Rainfall Forecast for August

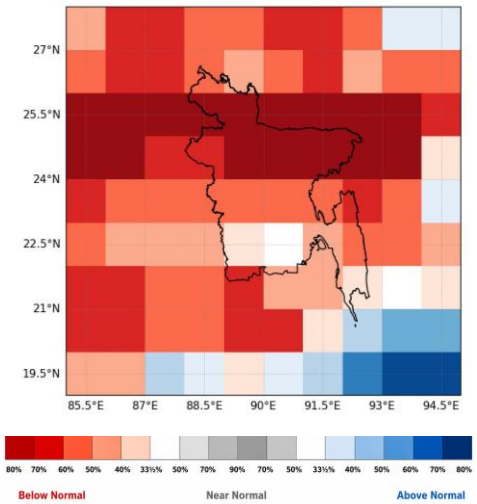

There is possibility of 1-2 Low Pressure System forming over the Bay of Bengal and one of them may intensify into a Monsoon Depression during August.

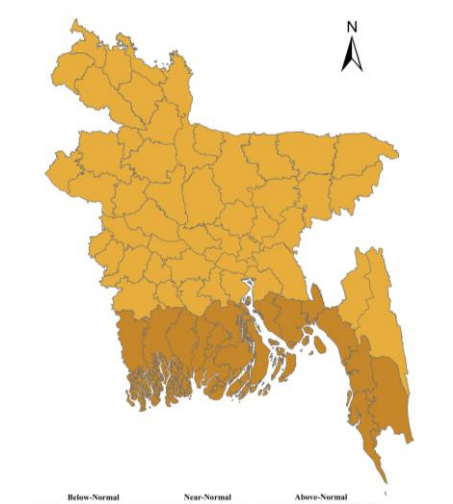

Outlook for August-September-October 2026

Considering World Meteorological Organization (WMO) designated global center model outputs, RIMES FOCUS probabilistic outlook, and BMD’s deterministic forecast, it is highly likely that the month of August-September-October would bring below normal rainfall for the Chattogram and Cox’s Bazar region. Based on the climatology (1991-2020) the normal cumulative rainfall for August-September-October in Cox’s Bazar is 1355 mm and in Teknaf is 1692 mm. Considering the available model output there is a 60-70% chance of below normal rainfall in the Cox’s Bazar region. Overall, the whole country may receive below normal rainfall during this three-month period.

BMD Deterministic Rainfall Forecast for ASO

Overview

The climate outlook provides a broader perspective of the possible climate for the coming month and season. This monthly and seasonal outlook (August and August-September-October) is generated by analyzing various global models and the monthly forecast of the Bangladesh Meteorological Department. In this outlook, forecast generated by the RIMES FOCUS tool is also included (which shall be tested experimentally for Bangladesh).

Interpretation of climate outlooks

In general, the climate outlooks are presented in two different ways. But first we need to explain **Normal**. Normal in climate terms is the Long Period Average (LPA) of the rainfall over a location using 30 years or more of rainfall data (measured at a station). The average is considered as the “Normal” rainfall for the region. And seasonal climate outlook is to estimate if the season will have more than Normal, less than Normal rainfall or equivalent to normal rainfall.

Forecast methods:

1. **Deterministic:** Deterministic forecast explains the percentage (%) departure from Normal. If we expect 20% or less than Normal rainfall, we call it to be **Below Normal**, if we expect 20% or more, we can it **Above Normal** and anything within the $\pm 20\%$ is called **Near Normal** rainfall for the season.

2. **Probabilistic:** The probabilistic approach explains the possibility (chance) of a certain amount of rainfall happening. For example, what is the chance of the season to be Below Normal, Normal or above Normal. If we say 45% Below normal, 30 % Normal, and 25 % Above Normal. There is a highly likely chance for the season to be Normal to Below Normal with a combined (75%) chance.

Important Note

Near Normal rainfall does not indicate there will be no or less extreme rainfall events. There can be high-intensity rainfall within a short period of time followed by dry spells which may sum up as Near Normal for the month. Users are advised to follow short and medium-range forecasts of BMD to keep track of extreme weather events. This outlook will be updated in the first week of September 2026.
